```

Issues

- *How to demarcate multiple regions of interest?*
 - Count objects
 - Compute further features per object
- *What to do with “noisy” binary outputs?*
 - Holes
 - Extra small fragments

Outline of Today's Lecture

- Convert the image into binary form
 - Thresholding
- Clean up the thresholded image
 - Morphological operators
- Extract individual objects
 - Connected Components Labeling

Thresholding

- *Grayscale image \Rightarrow Binary mask*
- *Different variants*

- *One-sided*

$$F_T[i,j] = \begin{cases} 1, & \text{if } F[i,j] \geq T \\ 0, & \text{otherwise} \end{cases}$$

- *Two-sided*

$$F_T[i,j] = \begin{cases} 1, & \text{if } T_1 \leq F[i,j] \leq T_2 \\ 0, & \text{otherwise} \end{cases}$$

- *Set membership*

$$F_T[i,j] = \begin{cases} 1, & \text{if } F[i,j] \in Z \\ 0, & \text{otherwise} \end{cases}$$

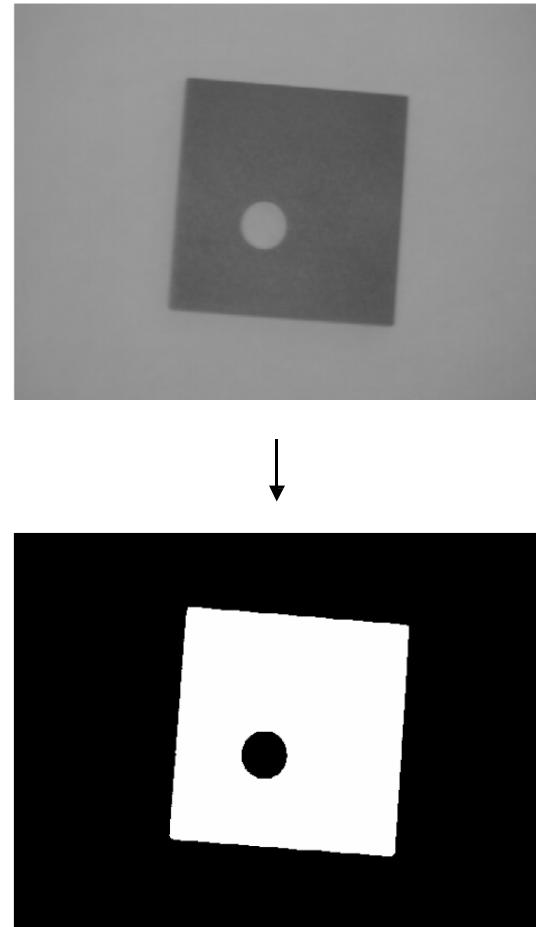

Image Source: <http://homepages.inf.ed.ac.uk/rbf/HIPR2/>

Thresholding

22 DEFINITION The histogram h of gray-tone image I is defined by

$$h(m) = |\{(r,c) \mid I(r,c) = m\}|,$$

where m spans the gray-level values.

Compute the histogram H of gray-tone image I .

```
procedure histogram(I,H);
{
    "Initialize the bins of the histogram to zero."
    for i := 0 to MaxVal
        H[i] := 0;
    "Compute values by accumulation."
    for L := 0 to MaxRow
        for P := 0 to MaxCol
            {
                grayval := I[r,c];
                H[grayval] := H[grayval] + 1;
            } ;
}
```

Thresholding

- Load trees
- *Binary_Image = Gray_Image.ThresholdBinary(new Gray(120), new Gray(255));*

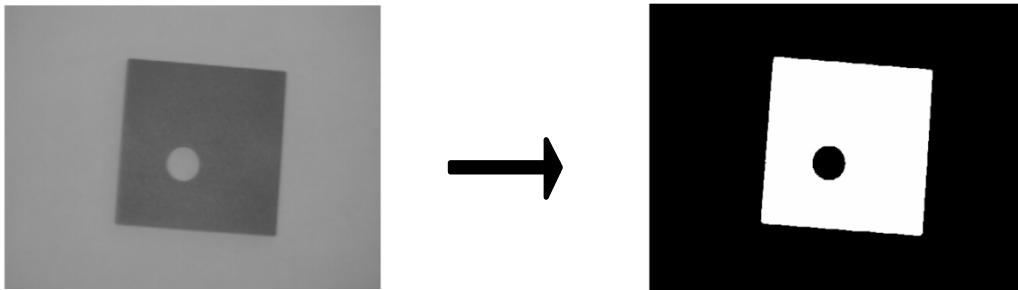

Image Courtesy of Susan Cohen

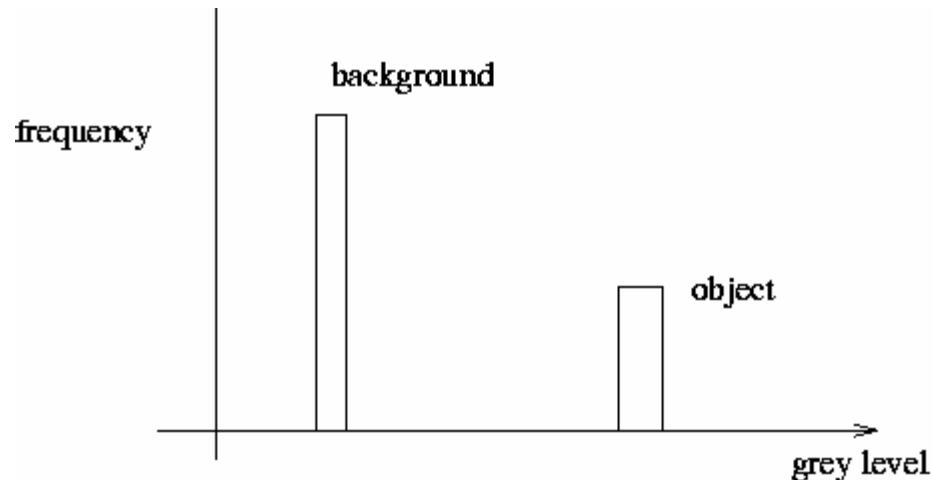

Selecting Thresholds

- *Typical scenario*
 - Separate an object from a distinct background

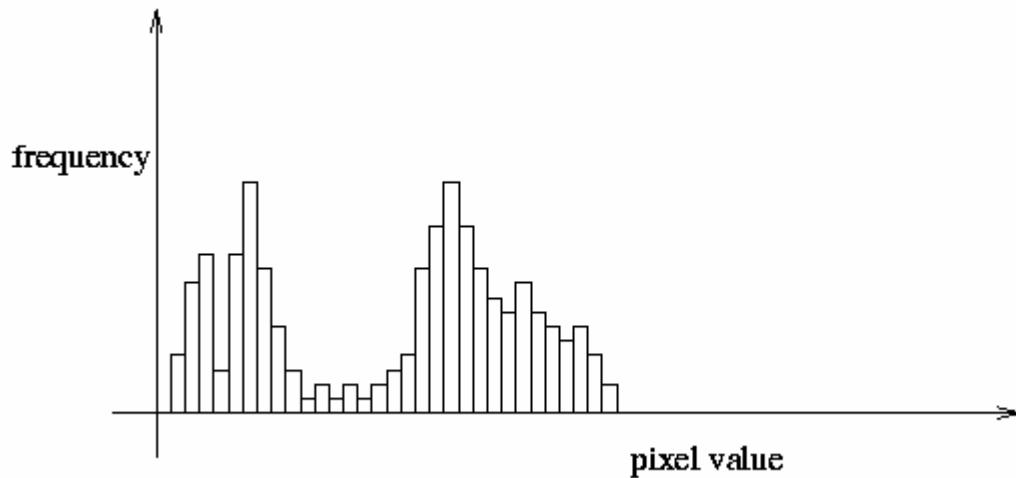

- Try to separate the different grayvalue distributions
 - Partition a bimodal histogram
 - Fit a parametric distribution (e.g. Mixture of Gaussians)
 - Dynamic or local thresholds
- In the following, I will present some simple methods.

A Nice Case: Bimodal Intensity Histograms

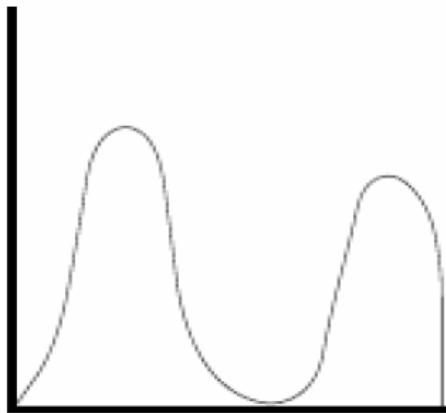

*Ideal histogram, light object
on dark background*

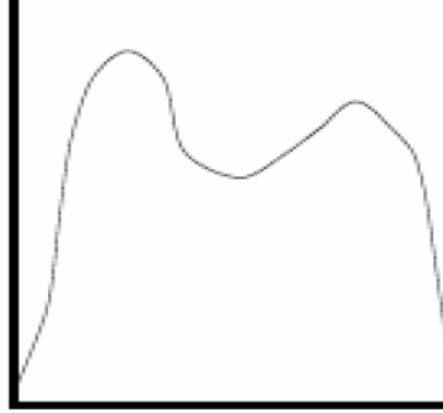

*Actual observed
histogram with noise*

Not so Nice Cases...

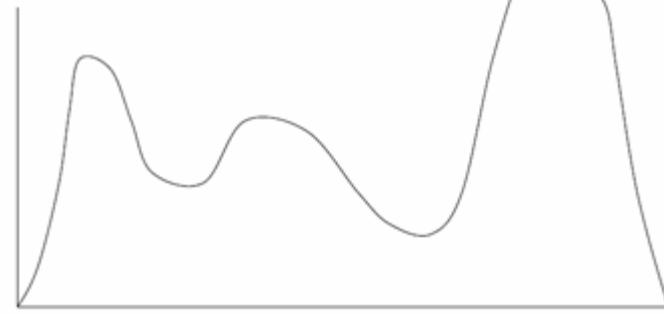

- *How to separate those?*

Two distinct modes

Overlapping modes

Multiple modes

- *Threshold selection is difficult in the general case*
 - *Domain knowledge often helps*
 - *E.g. Fraction of text on a document page (histogram quantile)*
 - *E.g. Size of objects/structure elements*

Global Binarization [Otsu'79]

- Search for the threshold T that minimizes the within-class variance σ_{within} of the two classes separated by T

$$\sigma_{within}^2(T) \stackrel{\text{def}}{=} n_1(T)\sigma_1^2(T) + n_2(T)\sigma_2^2(T)$$

where

$$n_1(T) = \left| \left\{ I_{(x,y)} < T \right\} \right|, \quad n_2(T) = \left| \left\{ I_{(x,y)} \geq T \right\} \right|$$

- This is the same as maximizing the between-class variance $\sigma_{between}$

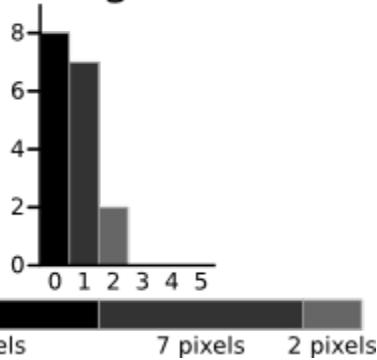

$$\sigma_{between}^2(T) = \sigma^2 - \sigma_{within}^2(T)$$

$$= n_1(T)n_2(T)[\mu_1(T) - \mu_2(T)]^2$$

Global Binarization [Otsu'79]

A 6-level greyscale image and its histogram

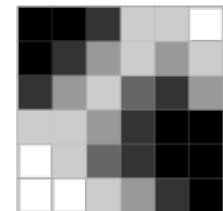

Background

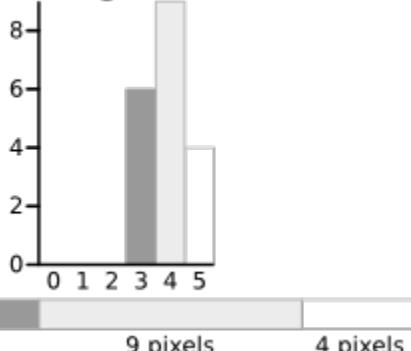

$$\text{Weight } W_b = \frac{8 + 7 + 2}{36} = 0.4722$$

$$\text{Mean } \mu_b = \frac{(0 \times 8) + (1 \times 7) + (2 \times 2)}{17} = 0.6471$$

$$\begin{aligned} \text{Variance } \sigma_b^2 &= \frac{((0 - 0.6471)^2 \times 8) + ((1 - 0.6471)^2 \times 7) + ((2 - 0.6471)^2 \times 2)}{17} \\ &= \frac{(0.4187 \times 8) + (0.1246 \times 7) + (1.8304 \times 2)}{17} \\ &= 0.4637 \end{aligned}$$

Foreground

$$\text{Weight } W_f = \frac{6 + 9 + 4}{36} = 0.5278$$

$$\text{Mean } \mu_f = \frac{(3 \times 6) + (4 \times 9) + (5 \times 4)}{19} = 3.8947$$

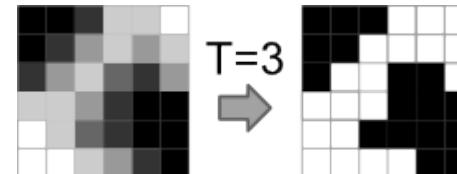

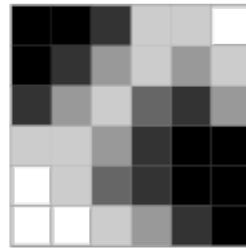

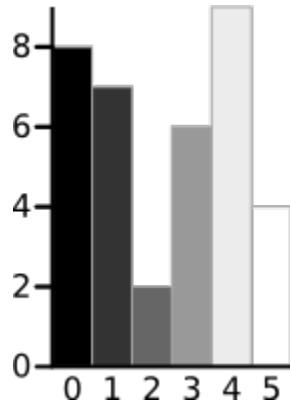

$$\begin{aligned} \text{Variance } \sigma_f^2 &= \frac{((3 - 3.8947)^2 \times 6) + ((4 - 3.8947)^2 \times 9) + ((5 - 3.8947)^2 \times 4)}{19} \\ &= \frac{(4.8033 \times 6) + (0.0997 \times 9) + (4.8864 \times 4)}{19} \\ &= 0.5152 \end{aligned}$$

Global Binarization [Otsu'79]

Threshold	T=0	T=1	T=2	T=3	T=4	T=5
Weight, Background	$W_b = 0$	$W_b = 0.222$	$W_b = 0.4167$	$W_b = 0.4722$	$W_b = 0.6389$	$W_b = 0.8889$
Mean, Background	$M_b = 0$	$M_b = 0$	$M_b = 0.4667$	$M_b = 0.6471$	$M_b = 1.2609$	$M_b = 2.0313$
Variance, Background	$\sigma^2_b = 0$	$\sigma^2_b = 0$	$\sigma^2_b = 0.2489$	$\sigma^2_b = 0.4637$	$\sigma^2_b = 1.4102$	$\sigma^2_b = 2.5303$
Weight, Foreground	$W_f = 1$	$W_f = 0.7778$	$W_f = 0.5833$	$W_f = 0.5278$	$W_f = 0.3611$	$W_f = 0.1111$
Mean, Foreground	$M_f = 2.3611$	$M_f = 3.0357$	$M_f = 3.7143$	$M_f = 3.8947$	$M_f = 4.3077$	$M_f = 5.000$
Variance, Foreground	$\sigma^2_f = 3.1196$	$\sigma^2_f = 1.9639$	$\sigma^2_f = 0.7755$	$\sigma^2_f = 0.5152$	$\sigma^2_f = 0.2130$	$\sigma^2_f = 0$
Within Class Variance	$\sigma^2_W = 3.1196$	$\sigma^2_W = 1.5268$	$\sigma^2_W = 0.5561$	$\sigma^2_W = 0.4909$	$\sigma^2_W = 0.9779$	$\sigma^2_W = 2.2491$

Within Class Variance $\sigma^2_W = W_b \sigma^2_b + W_f \sigma^2_f = 0.4722 * 0.4637 + 0.5278 * 0.5152 = 0.4909$

Global Binarization [Otsu'79]

Result of Otsu's method

A 6-level greyscale image and its histogram

- *A faster approach*

$$\text{Within Class Variance } \sigma_W^2 = W_b \sigma_b^2 + W_f \sigma_f^2 \quad (\text{as seen above})$$

$$\begin{aligned} \text{Between Class Variance } \sigma_B^2 &= \sigma^2 - \sigma_W^2 \\ &= W_b(\mu_b - \mu)^2 + W_f(\mu_f - \mu)^2 \quad (\text{where } \mu = W_b \mu_b + W_f \mu_f) \\ &= W_b W_f (\mu_b - \mu_f)^2 \end{aligned}$$

Threshold	T=0	T=1	T=2	T=3	T=4	T=5
Within Class Variance	$\sigma_W^2 = 3.1196$	$\sigma_W^2 = 1.5268$	$\sigma_W^2 = 0.5561$	$\sigma_W^2 = 0.4909$	$\sigma_W^2 = 0.9779$	$\sigma_W^2 = 2.2491$
Between Class Variance	$\sigma_B^2 = 0$	$\sigma_B^2 = 1.5928$	$\sigma_B^2 = 2.5635$	$\sigma_B^2 = 2.6287$	$\sigma_B^2 = 2.1417$	$\sigma_B^2 = 0.8705$

Algorithm

- Precompute a cumulative grayvalue histogram h .
For each potential threshold T
 - 1.) Separate the pixels into two clusters according to T
 - 2.) Look up n_1, n_2 in h and compute both cluster means
 - 3.) Compute $\sigma_{\text{between}}^2$

Choose

$$T^* = \arg \max_T [\sigma_{\text{between}}^2(T)]$$

$$\arg \max_x f(x) := \{x \mid \forall y : f(y) \leq f(x)\}$$

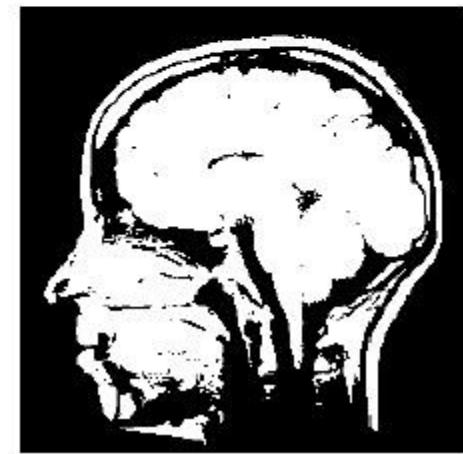

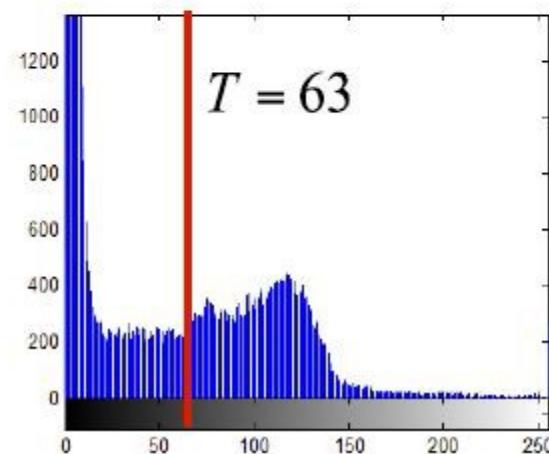

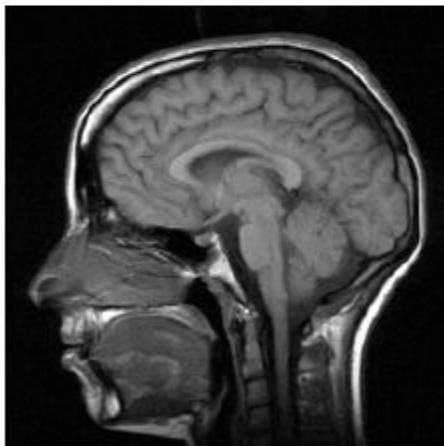

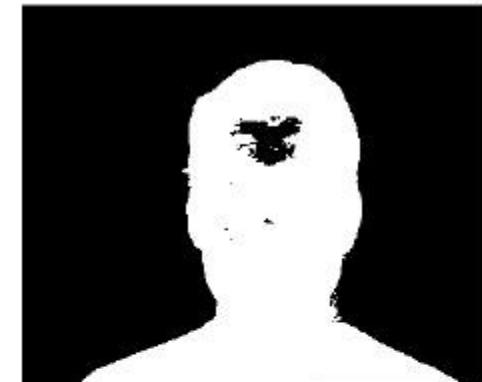

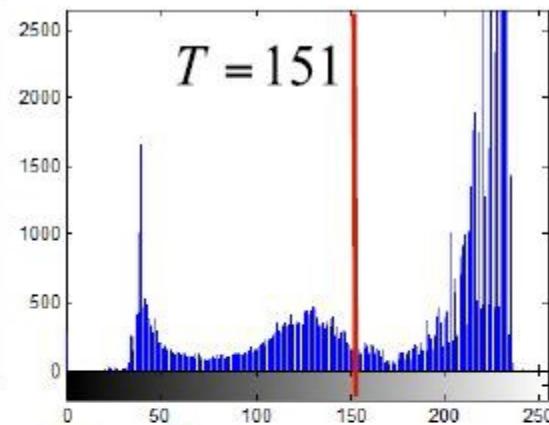

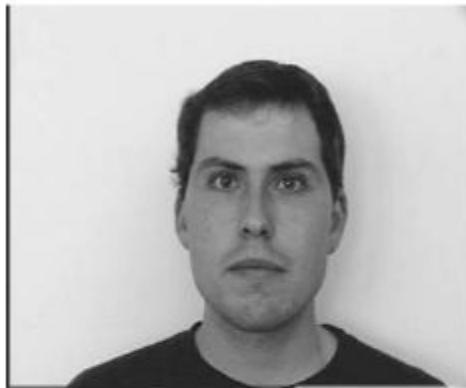

$$\arg \max_{x \in [0, 4\pi]} \cos(x) = \{0, 2\pi, 4\pi\}$$

Source code

Effects

graythresh - Global image threshold using Otsu's method

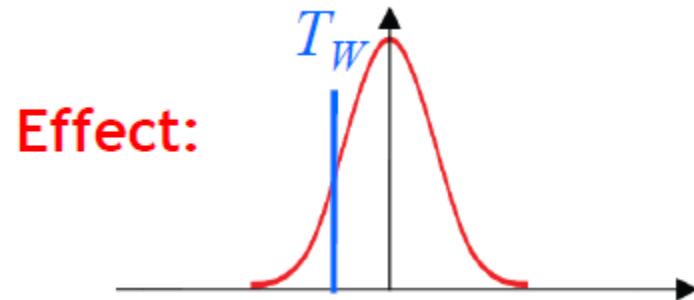

Local Binarization [Niblack'86]

- Estimate a local threshold within a small neighborhood

$$T_W = \mu_W + k \cdot \sigma_W$$

where $k \in [-1,1]$ is a user-defined parameter.

- Improved version to suppress background noise for document binarization [Sauvola'00]

$$T_W = \mu_W \left[1 + k \cdot \left(\frac{\sigma_W}{R} - 1 \right) \right]$$

*Useful for text,
but not for larger objects*

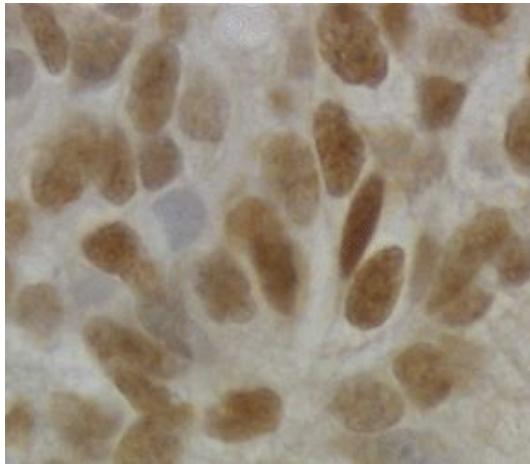

where R is the dynamic range of σ and $k > 0$

- Typical values: $R = 128$ for 8-bit images and $k \approx 0.5$

Global threshold(Otsu)

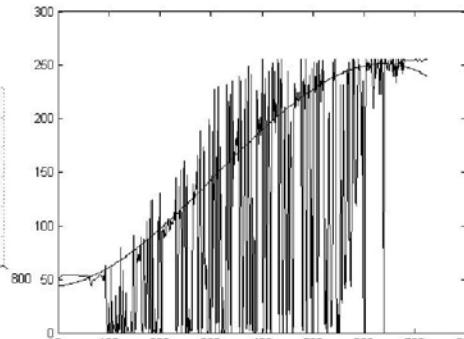

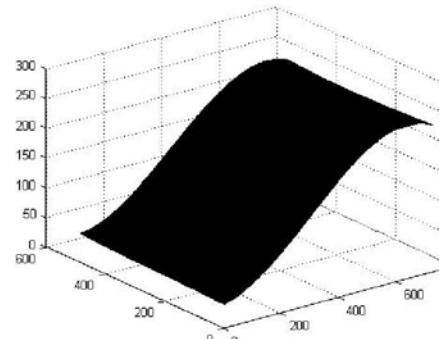

Local threshold(Niblack)

Additional Improvements

- Document images often contain a smooth gradient
 ⇒ Try to fit that gradient with a polynomial function

Figure 4: Face Dataset: We show the ROC curve for the full set SVM of 1434 support vectors (bold solid line), two reduced set methods of 10 and 100 reduced sets (both in dashed line). The dashed line of the 100 reduced set coincide almost entirely with the full set of support vectors. In addition, we show two element sets of 200 and 576 elements (both in solid line). Note that an element set of 576 elements is equivalent to a *single* support vector. Hence, the 576 element set is equivalent to the 10 reduced set in terms of classification power but uses much less memory.

Original image

Least squares and Projections

- We want to fit a straight line $y = c + dx$ to the data $(0, 1), (1, 4), (2, 2), (3, 5)$. This means we must find the c and d that satisfy the equations

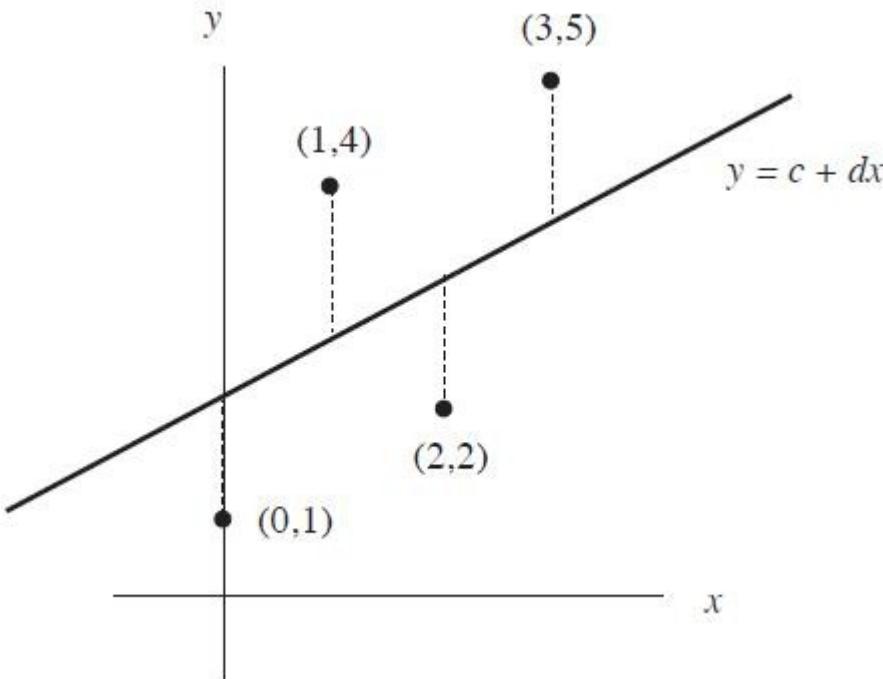

$$c + d \cdot 0 = 1$$

$$c + d \cdot 1 = 4$$

$$c + d \cdot 2 = 2$$

$$c + d \cdot 3 = 5$$

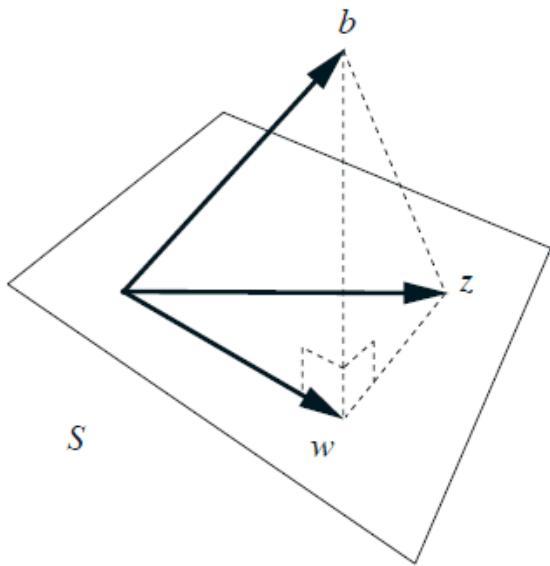

$$\begin{bmatrix} 1 & 0 \\ 1 & 1 \\ 1 & 2 \\ 1 & 3 \end{bmatrix} \begin{bmatrix} c \\ d \end{bmatrix} = \begin{bmatrix} 1 \\ 4 \\ 2 \\ 5 \end{bmatrix}$$

Linear least-squares using normal equations

$$Ax = b$$

A is an $m \times n$ matrix with $m > n$.

minimizes the norm $\|Ax - b\|$

$Ax - b$ must be a vector orthogonal to the column space of A . This means, explicitly, that $Ax - b$ is perpendicular to each of the columns of A .

$$A^T(Ax - b) = 0.$$

$$(A^T A)x = A^T b.$$

Objective

Find x that minimizes $\|Ax - b\|$.

Algorithm

- (i) Solve the normal equations $A^T Ax = A^T b$.
- (ii) If $A^T A$ is invertible, then the solution is $x = (A^T A)^{-1} A^T b$.

Surface Fitting

- *Polynomial surface of degree d*

$$f(x, y) = \sum_{i+j=0}^d b_{i,j} x^i y^j$$

$$f(x, y) = Ax^3 + Bx^2y + Cxy^2 + Dy^3 + Ex^2 + Fxy + Gy^2 + Hx + Iy + J$$

- *Least-squares estimation, e.g. for d=3 (m=10)*

$$Ab = I$$

$$\begin{bmatrix} 1 & x_0 & y_0 & x_0^2 & x_0y_0 & \cdots & y_0^3 \\ 1 & x_1 & y_1 & x_1^2 & x_1y_1 & \cdots & y_1^3 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & x_n & y_n & x_n^2 & x_ny_n & \cdots & y_n^3 \end{bmatrix} \begin{bmatrix} b_0 \\ b_1 \\ \vdots \\ b_m \end{bmatrix} = \begin{bmatrix} I_0 \\ I_1 \\ \vdots \\ I_n \end{bmatrix}, \quad \text{Solution with pseudo-inverse: } b = (A^T A)^{-1} A^T I$$

Surface Fitting

- *Iterative Algorithm*

- 1.) *Fit parametric surface to all points in region.*

- 2.) *Subtract estimated surface.*

- 3.) *Apply global threshold (e.g. with Otsu method)*

- 4.) *Fit surface to all background pixels in original region.*

- 5.) *Subtract estimated surface.*

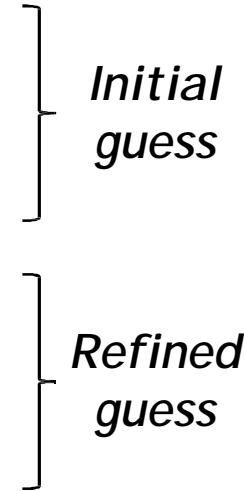

- 5.) *Apply global threshold (Otsu)*

- 6.) *Iterate further if needed...*

- *The first pass also takes foreground pixels into account.*

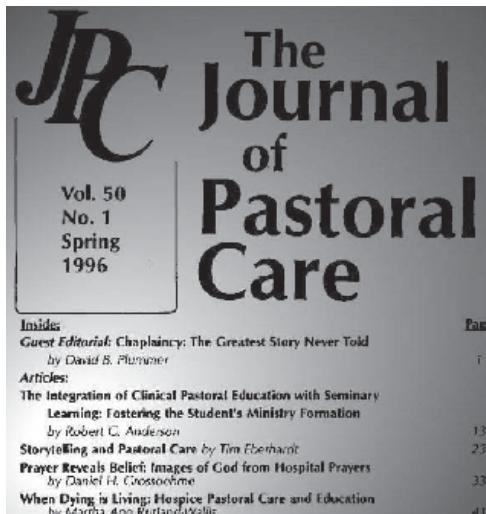

- *This is corrected in the following passes.*

- *Basic assumption here: most pixels belong to the background.*

Outline of Today's Lecture

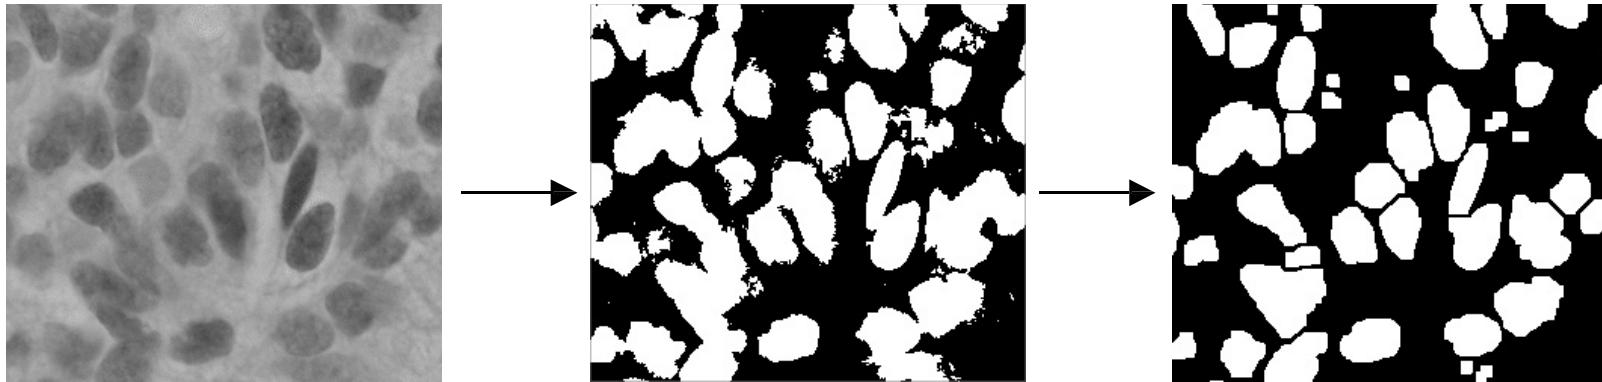

- *Clean up the thresholded image*
 - *Morphological operators*

Cleaning the Binarized Results

- *Results of thresholding often still contain noise*

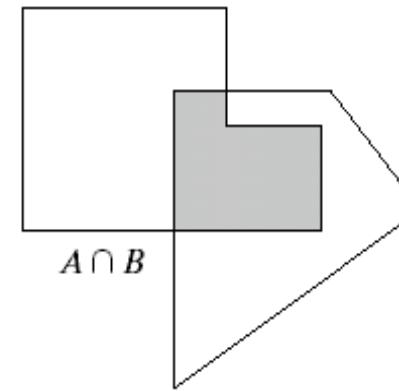

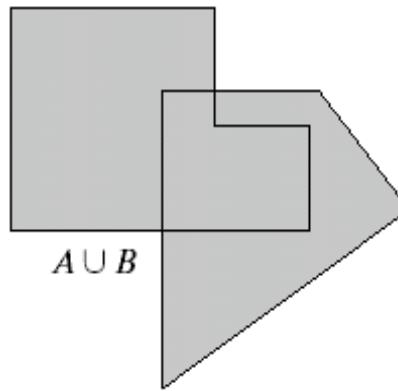

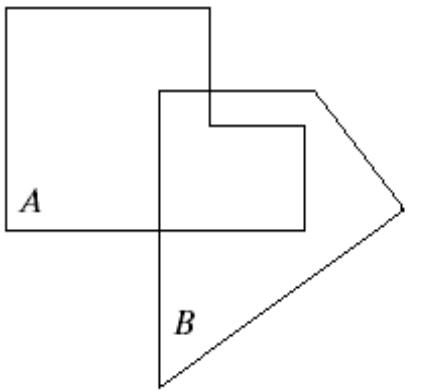

- *Necessary cleaning operations*
 - Remove isolated points and small structures
 - Fill holes

⇒ *Morphological Operators*

Z^2 and Z^3

- Set in mathematic morphology represent objects in an image
 - binary image ($0 = \text{white}$, $1 = \text{black}$) : the element of the set is the coordinates (x,y) of pixel belong to the object $\Leftrightarrow Z^2$
- Gray-scaled image : the element of the set is the coordinates (x,y) of pixel belong to the object and the gray levels $\Leftrightarrow Z^3$

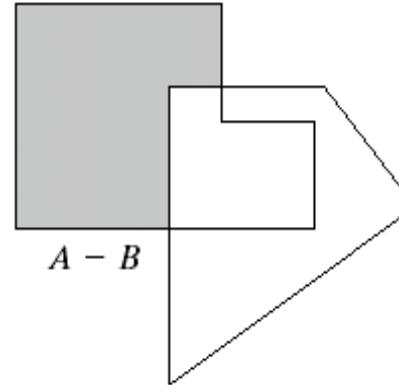

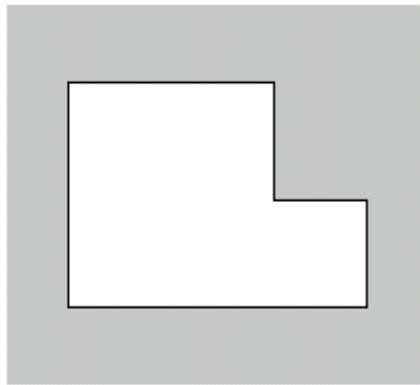

Basic Set Theory

a	b	c
d	e	

FIGURE 9.1

- (a) Two sets A and B . (b) The union of A and B .
(c) The intersection of A and B . (d) The complement of A .
(e) The difference between A and B .

Logic Operations

p	q	$p \text{ AND } q$ (also $p \cdot q$)	$p \text{ OR } q$ (also $p + q$)	NOT (p) (also \bar{p})
0	0	0	0	1
0	1	0	1	1
1	0	0	1	0
1	1	1	1	0

Example

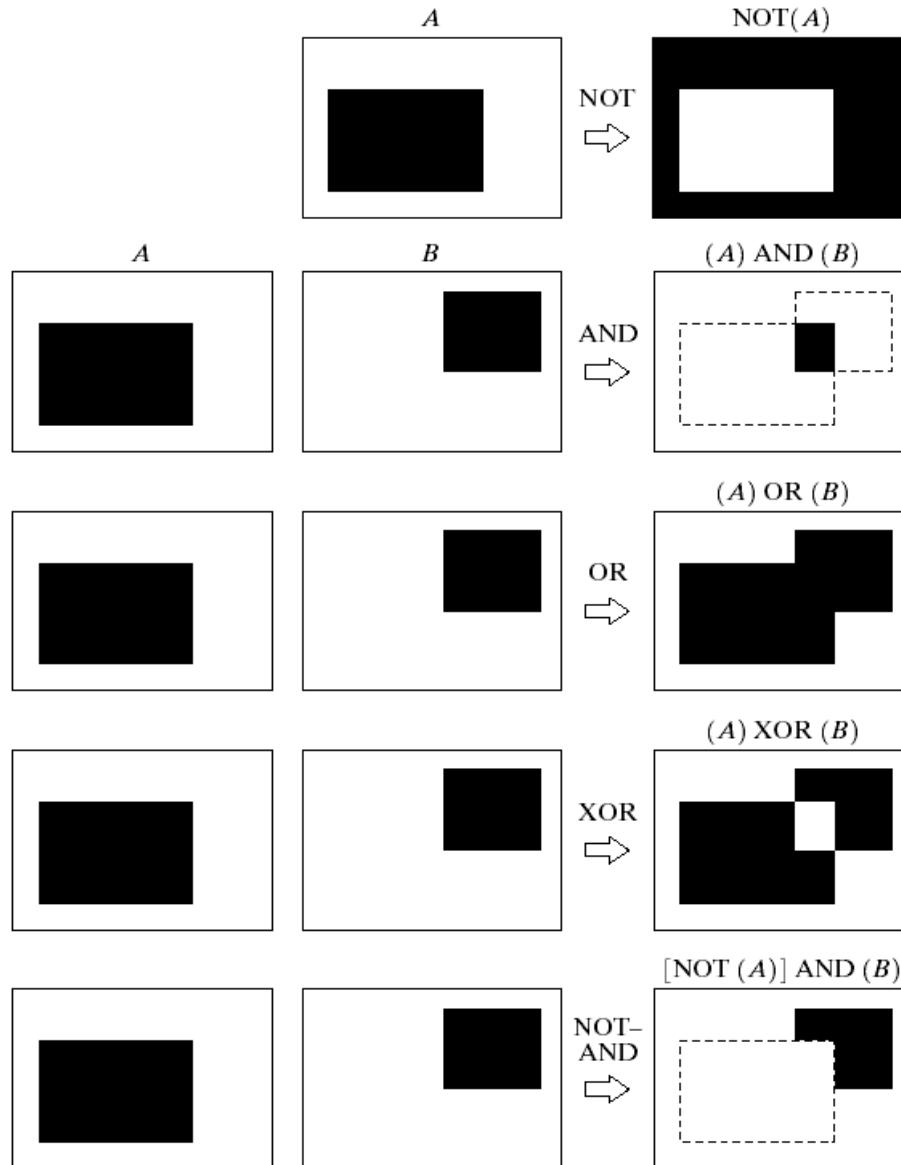

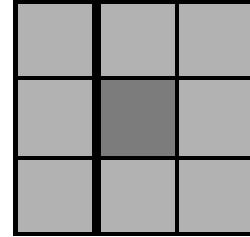

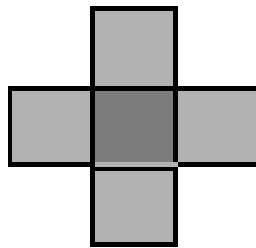

FIGURE 9.3 Some logic operations between binary images. Black represents binary 1s and white binary 0s in this example.

Structuring Element (SE)

- *Small set to probe the image under study*
- *Shape and size must be adapted to geometric properties for the objects*

Basic morphological operations

- *Erosion*

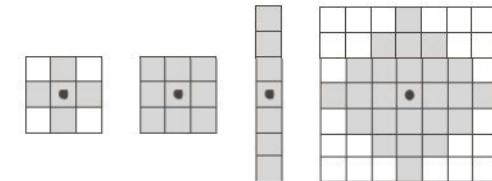

- *Dilation*

- *Combine to*
 - *Opening*
 - *Closing*

Morphological Operators

- *Basic idea*
 - Scan the image with a structuring element
 - Perform set operations (intersection, union) of image content with structuring element
- *Two basic operations*
 - *Dilation* (Matlab: `imdilate`)
 - *Erosion* (Matlab: `imerode`)
- *Several important combinations*
 - *Opening* (Matlab: `imopen`)
 - *Closing* (Matlab: `imclose`)
 - *Boundary extraction*

```
Image<Gray, Byte> src = new Image<Gray, Byte>( "Your Image.png" );
Image<Gray, Byte> dst = new Image<Gray, Byte>( src.Width, src.Height );
StructuringElementEx element = new StructuringElementEx( 3, 3, 1, 1, Emgu.CV.CvEnum.CV_ELEMENT_SHAPE.CV_SHAPE_CROSS );
CvInvoke.cvMorphologyEx( src, dst, IntPtr.Zero, element, CV_MORPH_OP.CV_MOP_OPEN, 1 );
```

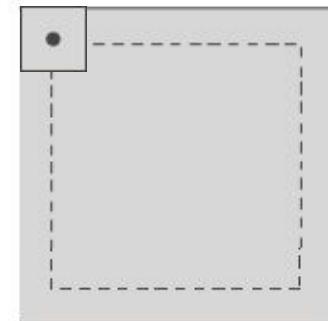

Dilation

- ***Definition***

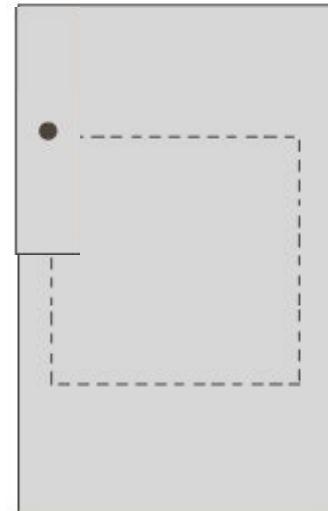

- “*The dilation of A by B is the set of all displacements z, such that $(\hat{B})_z$ and A overlap by at least one element*”.
- $(\hat{B})_z$ is the mirrored version of B, shifted by z)

- ***Effects (foreground=1, background=0)***

- If current pixel z is foreground, set all pixels under $(B)_z$ to foreground.
⇒ Expand connected components
⇒ Grow features
⇒ Fill holes

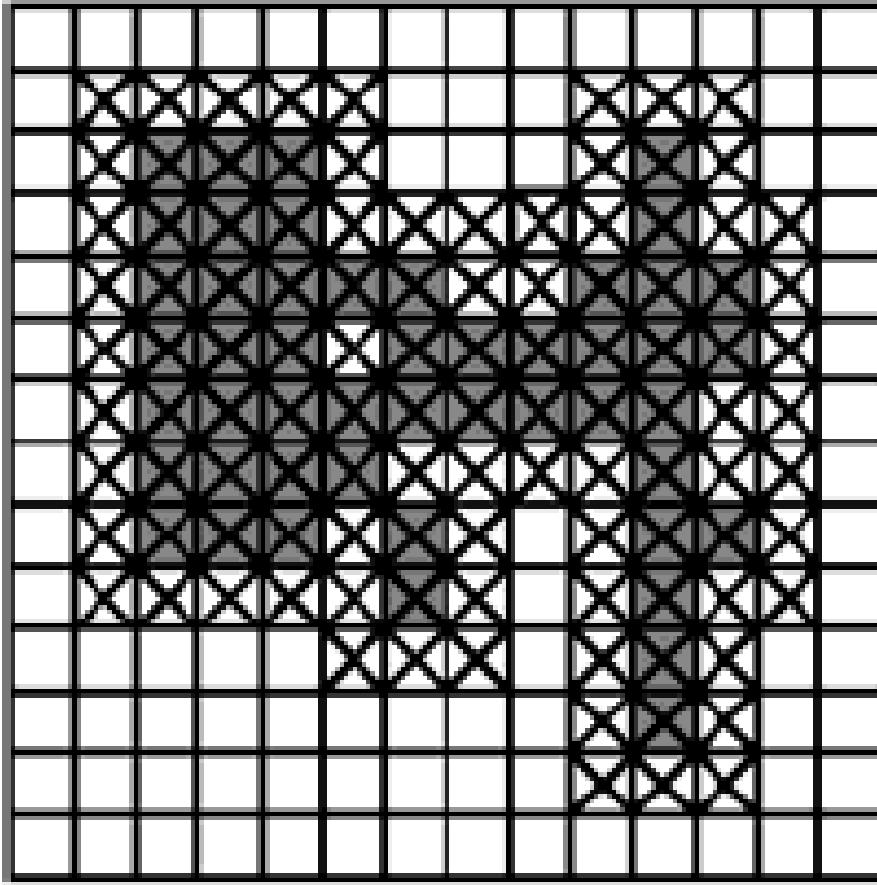

A

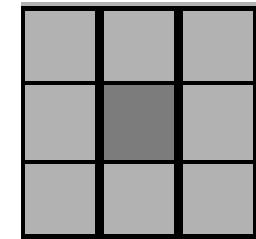

$A \oplus B_2$

Erosion

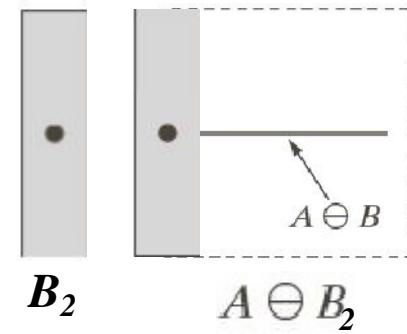

- *Definition*

- “The erosion of A by B is the set of all displacements z , such that $(B)_z$ is entirely contained in A ”

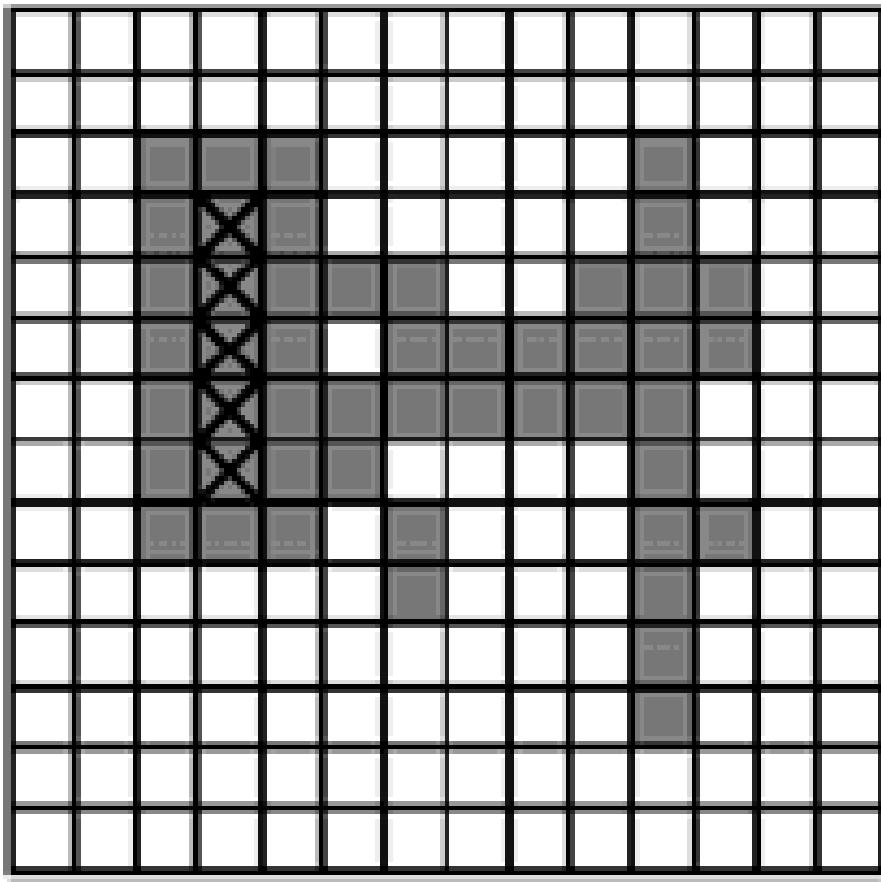

- *Effects*

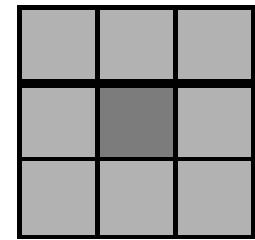

- If not every pixel under $(B)_z$ is foreground, set the current pixel z to background.
- ⇒ Erode connected components
- ⇒ Shrink features
- ⇒ Remove bridges, branches, noise

Effect of Closing

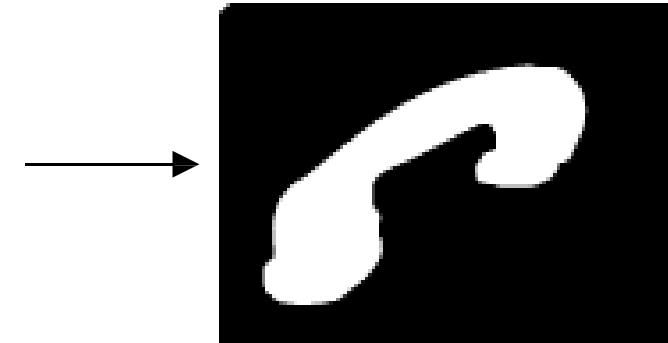

- *Fill holes in thresholded image (e.g. due to specularities)*

Original image

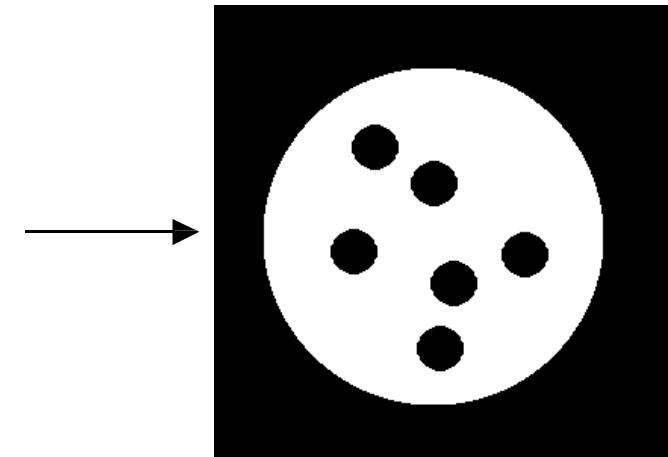

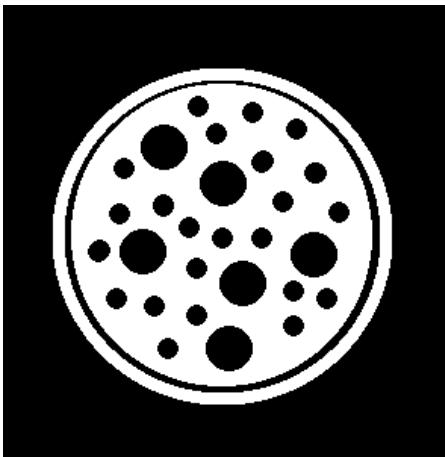

Thresholded

Closing with circular structuring element

Size of structuring element determines which structures are selectively filled.

Example Application: Opening + Closing

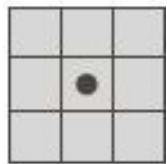

Original image

Opening

Closing

*Structuring
element*

Eroded image

Dilated image

Morphological Boundary Extraction

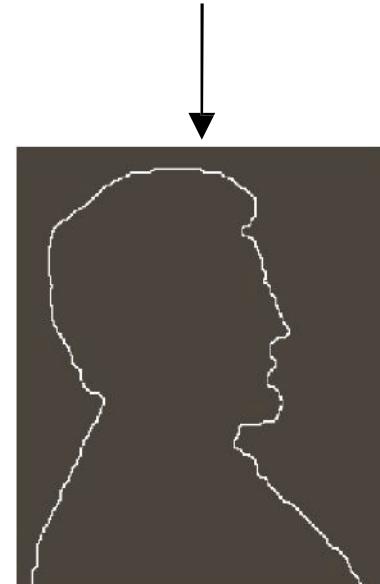

- *Definition*

- First erode A by B , then subtract the result from the original A .

$$\beta(A) = A - (A \ominus B)$$

- *Effects*

- If a 3×3 structuring element is used, this results in a boundary that is exactly 1 pixel thick.

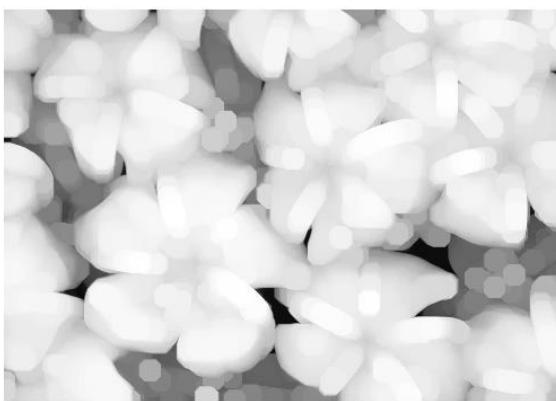

Morphology Operators on Grayscale Images

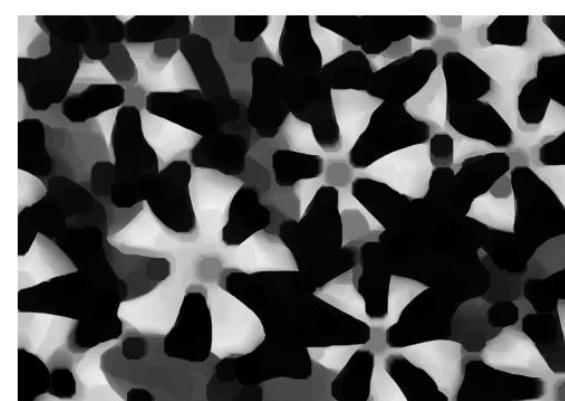

- *Dilation and erosion typically performed on binary images.*
- *If image is grayscale: for dilation take the neighborhood max, for erosion take the min.*

Original

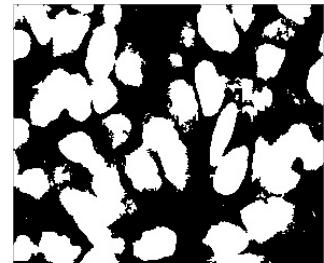

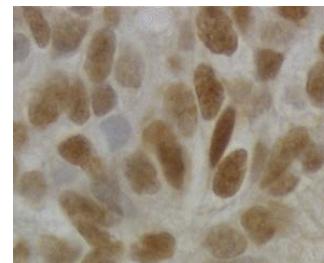

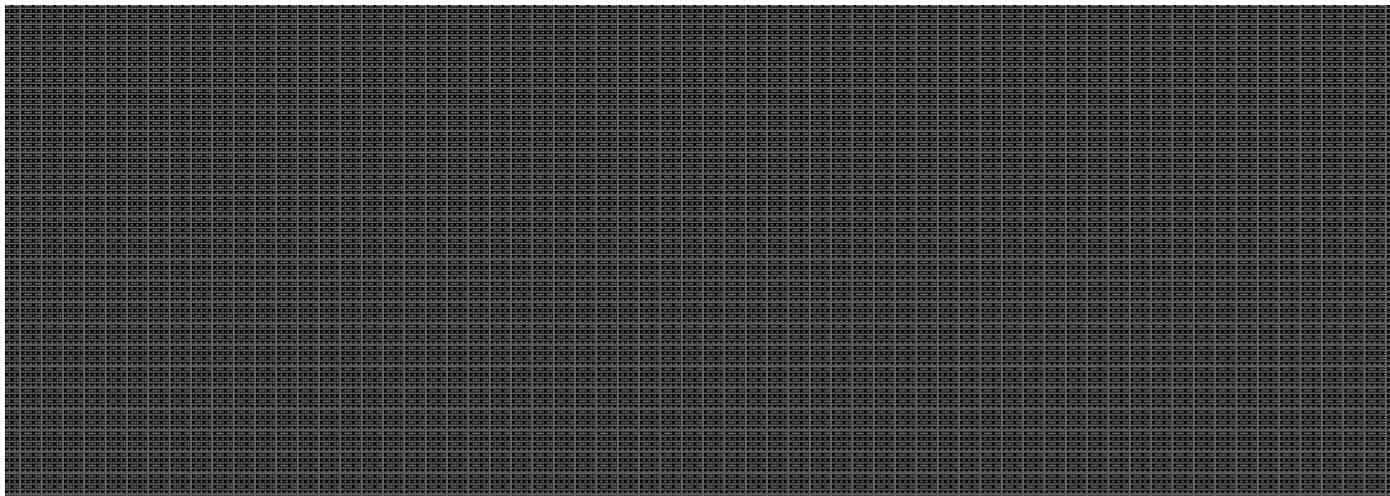

Dilated

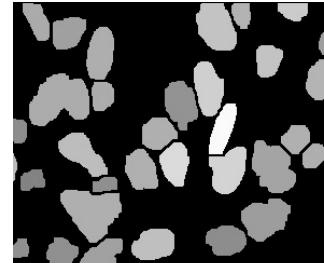

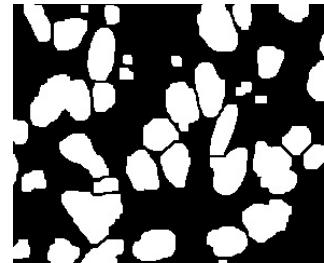

Eroded

- *In dilation, image becomes lighter, and dark details are reduced.*
- *In erosion, image becomes darker, and light details are reduced.*

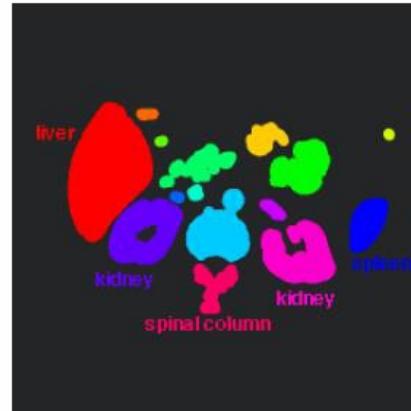

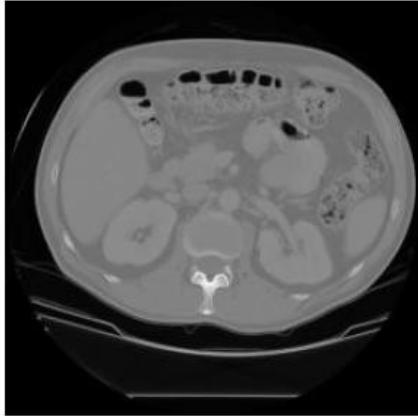

Outline of Today's Lecture

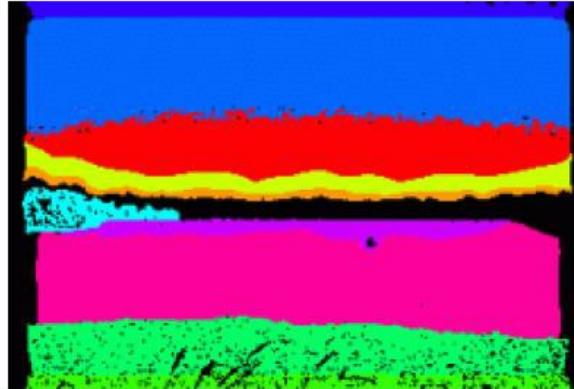

- *Extract individual objects*
 - *Connected Components Labeling*

Connected Components Examples

labels

Connected Components Labeling

- Goal: Identify distinct regions

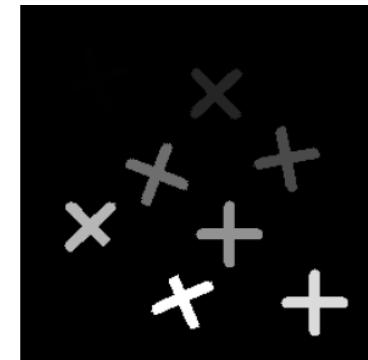

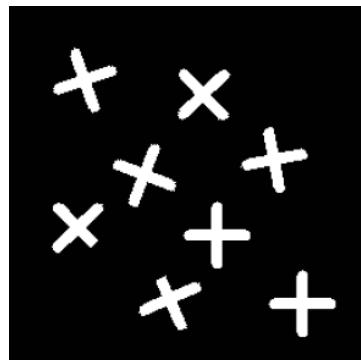

1	1	0	1	1	1	0	1
1	1	0	1	0	1	0	1
1	1	1	1	0	0	0	1
0	0	0	0	0	0	0	1
1	1	1	1	0	1	0	1
0	0	0	1	0	1	0	1
1	1	0	1	0	0	0	1
1	1	0	1	0	1	1	1

Binary image

1	1	0	1	1	1	0	2
1	1	0	1	0	1	0	2
1	1	1	1	0	0	0	2
0	0	0	0	0	0	0	2
3	3	3	3	0	4	0	2
0	0	0	3	0	4	0	2
5	5	0	3	0	0	0	2
5	5	0	3	0	2	2	2

Connected components labeling

Recursive Labeling Connected Component Exploration

Procedure Label (Pixel)

BEGIN

 Mark(Pixel) <- Marker;

 FOR neighbor in Neighbors(Pixel) DO

 IF Image (neighbor) = 1 AND Mark(neighbor)=nil THEN

 Label(neighbor)

END

BEGIN Main

 Marker <- 0;

 FOR Pixel in Image DO

 IF Image(Pixel) = 1 AND Mark(Pixel)=nil THEN

 BEGIN

 Marker <- Marker + 1;

 Label(Pixel);

 END;

 END

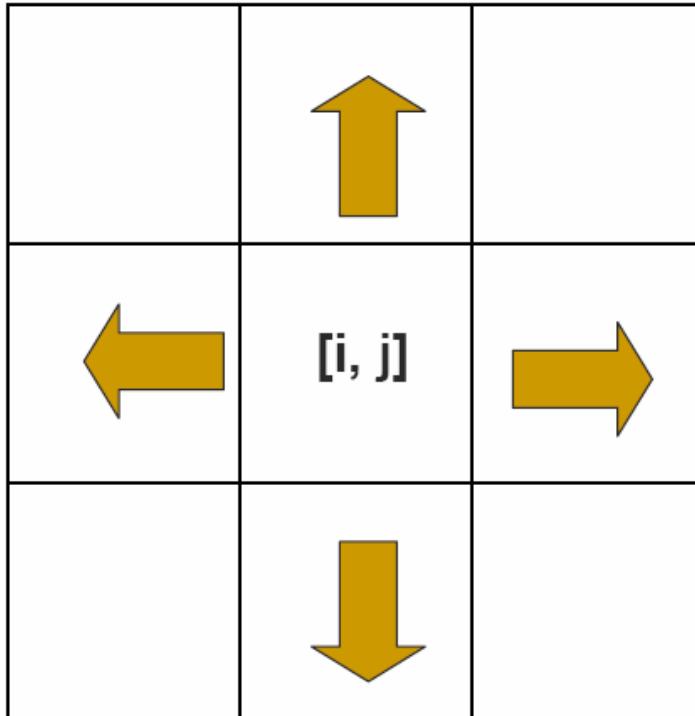

Globals:

Marker: integer

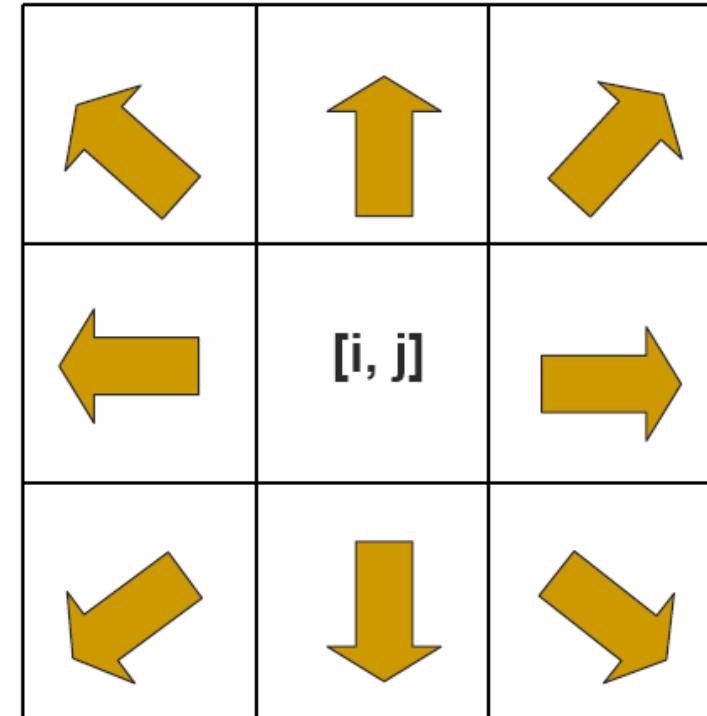

Mark: Matrix same size as Image,
initialized to NIL

Connectedness

- Which pixels are considered neighbors?

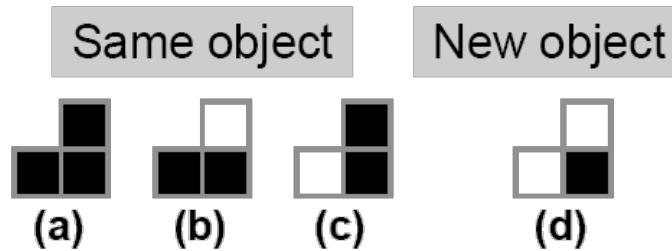

4-connected

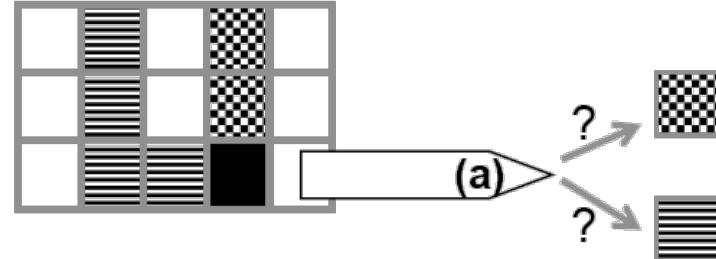

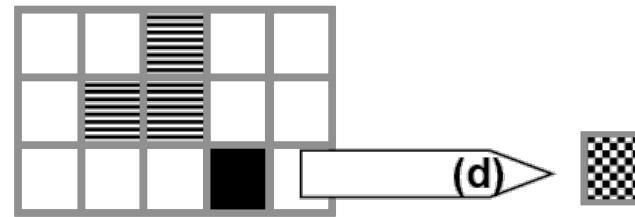

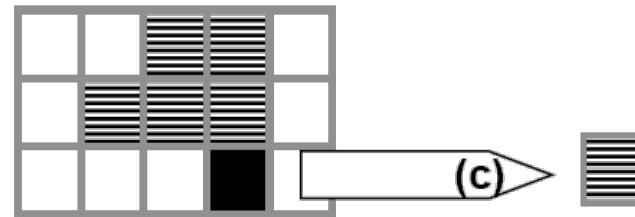

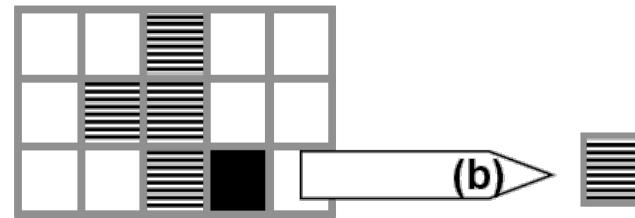

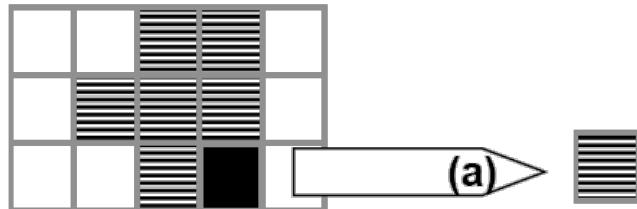

8-connected

Sequential Connected Components

- Labeling a pixel only requires to consider its prior and superior neighbors.
- It depends on the type of connectivity used for foreground (4-connectivity here).

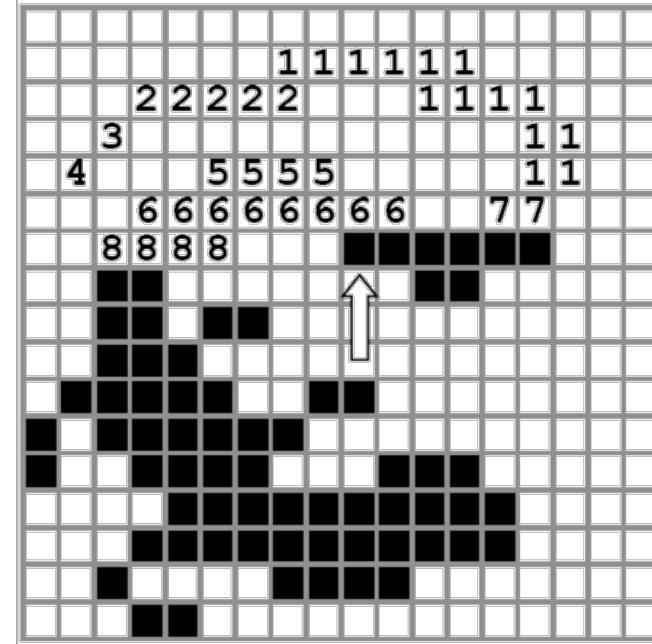

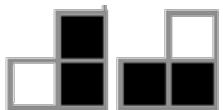

What happens in these cases?

Equivalence table

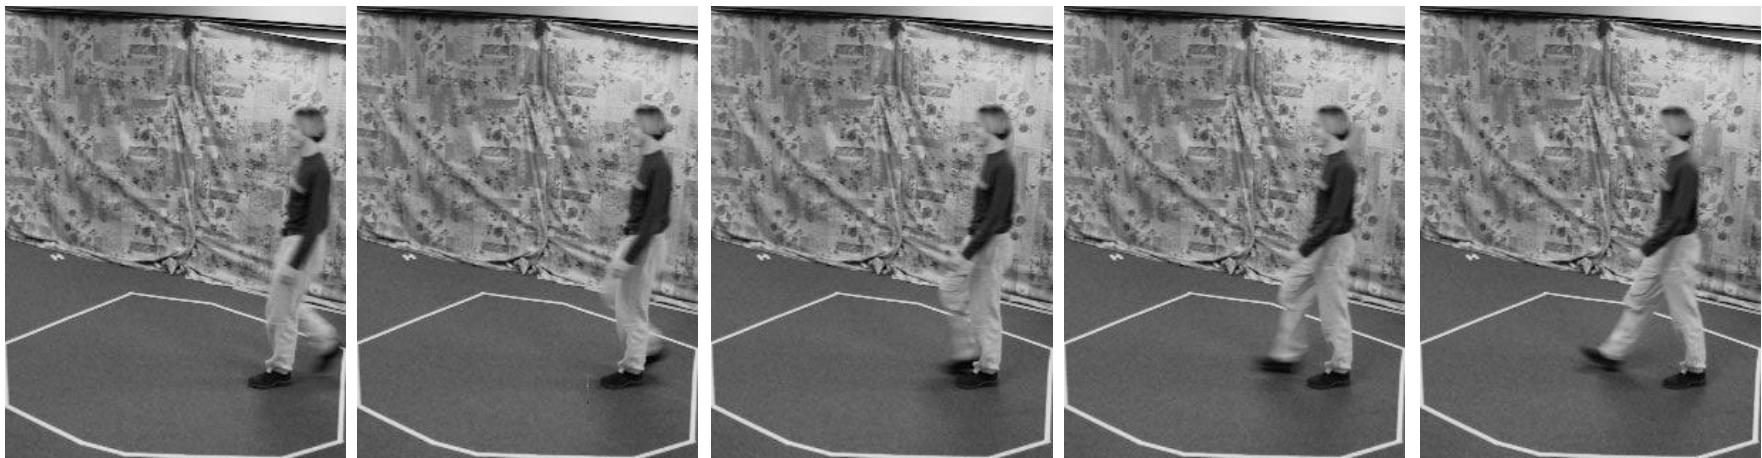

Sequential Connected Components

- Process the image from left to right, top to bottom:
 - 1.) If the next pixel to process is 1
 - i.) If only one of its neighbors (top or left) is 1, copy its label.
 - ii.) If both are 1 and have the same label, copy it.
 - iii.) If they have different labels
 - Copy the label from the left.
 - Update the equivalence table.
 - iv.) Otherwise, assign a new label.
- Re-label with the smallest of equivalent labels

Extract Largest Region

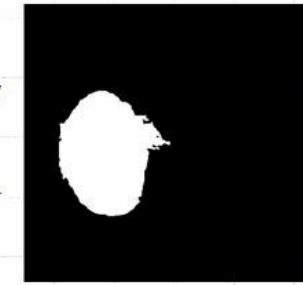

Region Filling

Extract Largest Region

Boundary Peeling

Application by Jie Zhu, Cornell University

Summary: Binary Image Processing

- *Pros*
 - *Fast to compute, easy to store*
 - *Simple processing techniques*
 - *Can be very useful for constrained scenarios*
- *Cons*
 - *Hard to get “clean” silhouettes*
 - *Noise is common in realistic scenarios*
 - *Can be too coarse a representation*
 - *Cannot deal with 3D changes*
